It has been found very beneficial to sow these fertilizers between the rows before cultivating and hoeing the second time.

We have been very careful in selecting the best and sweetest varieties of corn adapted to this section. The list below is arranged in order as they would mature. If two or more varieties are selected and planted at same time, they would be ready for the table at different times, one following the other.

MUSHROOM SPAWN

CULTURE.—Mushrooms are more easily cultivated than many people imagine and may be grown in any room or cellar where the temperature can be maintained at from 50 to 65 degrees. For the beds use a mixture of three parts horse droppings and one part good fresh loam. Before being placed in the bed, let the manure be put in some dry place to sweeten, mixing it thoroughly and turning it three or four times, when the loam may be added. Upon a dry firm bottom or shelf, make the bed by spreading a thin layer of the prepared mixture, pouncing it firm, and continue this, till the bed is twelve inches thick. Leave it thus for about a week, or until the temperature has subsided to 85 degrees. Then make holes about ten inches apart, and put in each a piece of spawn about the size of an egg. Press the spawn firmly into the compost about two inches, leaving the top uncovered to allow the excess of heat and moisture to pass off without injury to the germs. After ten days, fill the holes and cover the whole bed with two inches of fresh loam, and over this place a few inches of straw. If the temperature is right, mushrooms will appear in six or eight weeks from the time of spawning. The bed will continue bearing from four to six weeks. If the surface of the bed becomes dry at any time, it should be moistened freely with water at a temperature of 90 to 100 degrees.

Our stock of spawn is replaced a number of times during the season and is giving excellent results.

POTATOES

CULTURE.—So many conflicting opinions exist as to the best method of growing potatoes, that we do not venture to give directions for culture. We do, however, make the following suggestions: Plant in such a manner that most of the heavy hard work can be done by the horse. Use “Mapes Potato Manure,” or “Quinnipiac Potato or Market Garden,” in sufficient quantities to insure a crop. Always bear in mind that to get the full benefit of the fertilizer and not burn the roots it should be thoroughly mixed with the soil. If stable manure is used at all, it should not come in contact with the tubers, as it is sure to make the crop rough and scabby.

These Potatoes were raised from our Maine Grown Seed, the crop was uniform and heavy and of excellent quality.

POTATOES

Use the “Quinnipiac or Mapes Fertilizers.” To insure quantity and quality in your potato crop there are positively no better fertilizers made.

Prices subject to Variation

These are the prices ruling in January—they are subject to change without notice.

Early Potatoes

The Potatoes we offer were grown and harvested in Maine especially for seed purposes.

SWEET PEAS

Our list of Sweet Peas has been carefully revised with a view of keeping it strictly up to date. Should you miss some old favorite in the list, it has been discarded in favor of an improved sort. White seeded varieties should not be sown until the ground is comparatively dry and warm. If sown under wet and cold conditions the seed may rot in the ground. With few exceptions Sweet Peas are black seeded and do not appear to be affected like the white seeded sorts.

LAWN GRASS SEED

Our Lawn Grass Seed is a specially reliable mixture of fine growing grasses, entirely free from weed seeds and can be depended on to produce a perfect, velvety green turf if properly sown and cared for. Quantity required per acre, 4 bushels. Price per quart, 25c., ½ peck, 85c., peck, $1.50, bushel, $5.50.

Points worth Remembering in Making a Lawn.

At least six inches of the surface soil should be alike and even, for nothing looks worse than to see a lawn grown in patches. So many noxious weeds are introduced into the ground with barnyard manure that its use is not recommended. The ground should be well prepared and rolled previous to sowing, it should then be gone over with a fine rake, the seed then evenly scattered over the surface at the rate of four bushels per acre. The whole should then be raked or bushed in and again rolled. When the grass has attained a height of three inches, it should be cut with a sharp scythe; never use a lawn mower that "pinches off" or "pulls" the grass, it should "clip" it with a good shear cut. Frequent mowings and rollings are necessary to keep a lawn in good condition. Once or twice during the season an application of Mapes or Quinipiack should be applied as a top dressing. To "thicken up" the grass use one bushel lawn seed per acre. Don't forget the roller. Use a good Lawn Mower, in good cutting order.

Repairing Lawn Mowers

We repair and sharpen Lawn Mowers of all kinds, putting them in first-class working order. Should any be sent to us that are too nearly worn out to repair, we will so advise.

We would be pleased to give you figures on the Carrier at the store or put up in your barn ready for use. The Diamond can be arranged to unload hay from the load to the mow, or from the mow to the wagon. We would like to refer you to parties who are using them. Should you wish a cheaper equipment than our Diamond we can furnish it.

There is less liability of getting churns too large than too small. Be sure and order churns large enough. There must be room in the churn to produce the concussion, and a small churn filled too full will require a longer time for churning.
